

Task W06: Stacks and Queues

Data Structures, Grade Sheet

Name:

Date:

Language used (circle one): Java C/C++

Submission and setup

3 pts

Submitted the entire labw06 project (Eclipse project for Java, full folder including the Makefile for C/C++), not just individual files

/ 1

Project compiles and runs without errors

/ 1

Required header comment present at the top of every submitted source file

/ 1

Code quality

3 pts

Naming and formatting are reasonable and consistent with the starter code

/ 1

No leftover dead code, stray debugging output, or commented-out blocks

/ 1

Only minor edits made to display()'s print statements; no larger rewrites of Stack or Queue

/ 1

Choosing Structures

8 pts

size() added to both Stack and Queue, backed by an internal count

/ 2

size() does not itself enforce any capacity limit

/ 2

Main-method comment explains which structure was used for each role, and why, using correct terminology

/ 2

The structure choices themselves are actually appropriate for the lane, the waiting line, and the displacement handling

/ 2

Required Behavior

12 pts

arrive() parks directly when there is room

/ 2

arrive() joins the waiting line when the garage is full

/ 2

leave() correctly displaces and restores cars in their original relative order when not nearest the exit

/ 2

leave() admits from the waiting line immediately once a spot opens

/ 2

leave() on a not-found car prints the correct message, leaves state unchanged, and continues processing

/ 2

Prompts for the event file and garage capacity, reads from the files folder correctly

/ 2

Output Format and Correctness

10 pts

Output is exactly three lines per event, in the specified format

/ 2

Output matches expected results on sample_events_07.txt

/ 2

Output matches expected results on test_events_50.txt

/ 2

Output matches expected results on test_events_100.txt

/ 2

Output matches expected results on my testing files

/ 2
