

COURSE PREP

Terminal Setup for Tuesday

A five minute checklist for your Linux terminal

This week's class session will use a handful of command line utilities that inspect your system's hardware. Most of these ship by default on Ubuntu style distributions, but on a minimal install such as Arch, Gentoo, or Void, they are usually not installed until you ask for them. Please install the packages below before Tuesday so that class time is spent looking at your machine rather than waiting on a package manager.

Already covered. If you are running a more common distribution, such as Ubuntu, Fedora, or Debian, most of these tools are frequently preinstalled or a single command away. Run the verification step below first. If everything already prints a path, there is nothing else to do.

1. Packages to install

Table 1: Install commands by distribution.

Distribution	Command
Arch Linux	<code>sudo pacman -S pciutils usbutils ethtool iw hdparm</code>
Gentoo	<code>sudo emerge -ask sys-apps/pciutils sys-apps/usbutils sys-apps/ethtool net-wireless/iw sys-apps/hdparm</code>
Void Linux	<code>sudo xbps-install -S pciutils usbutils ethtool iw hdparm</code>

If you are on a distribution not listed here, install the same five packages, pciutils, usbutils, ethtool, iw, and hdparm, through your package manager's equivalent command.

2. Verify it worked

Run the following, and confirm each line prints a path rather than "not found."

```
which lspci lsusb ethtool iw hdparm
```

No sudo on this machine? If you are on a shared or managed machine without sudo access, or you run into a permission error you cannot resolve, message me before Tuesday and we will sort out an alternative for that class session.
