

MySQL and Workbench Install

Course Document

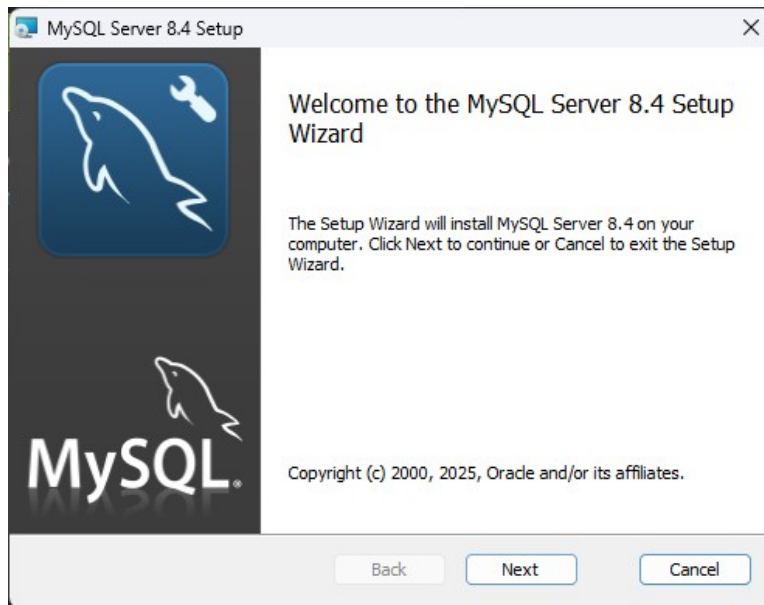

Installing MySQL Server and MySQL Workbench on Windows

This guide walks you through installing MySQL Server and MySQL Workbench on Windows, configuring the server, and connecting to it.

Note: This guide sometimes refers to MySQL 8.4.7 LTS. The latest version is 8.4.11 LTS, so you may need to adapt some of these instructions slightly, such as version numbers or minor screen differences.

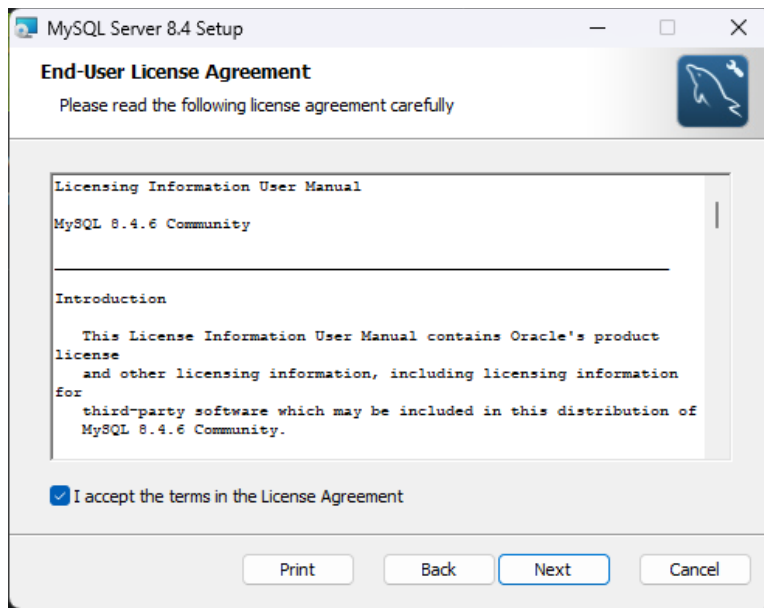

1. Install MySQL Server

1. Download MySQL 8.4.11 LTS. This is the most stable version.
2. Start the installer and click **Next**.

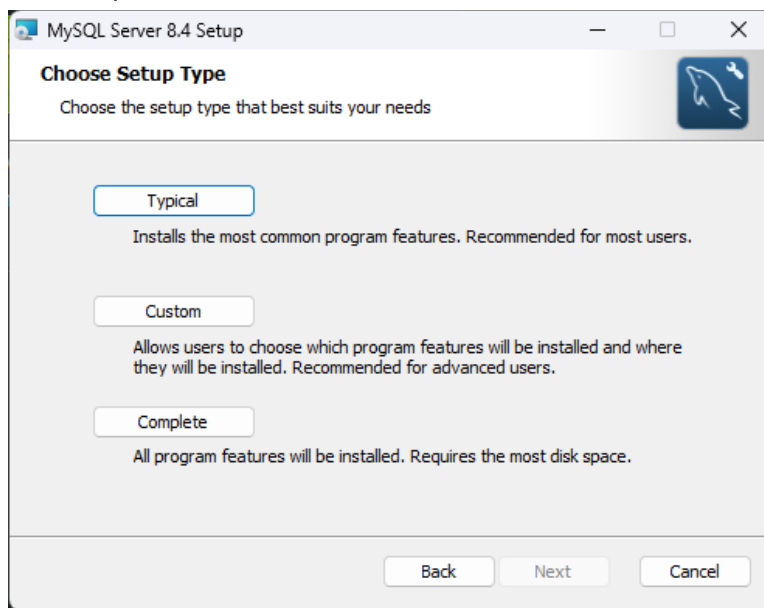

MySQL Installer welcome screen

3. Accept the license agreement and click **Next**.

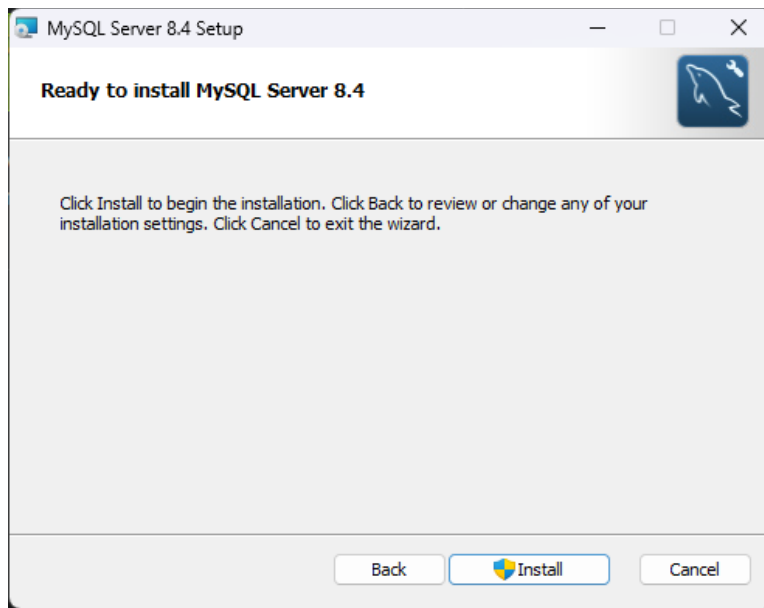

Accepting the license agreement

4. Select the **Typical** setup.

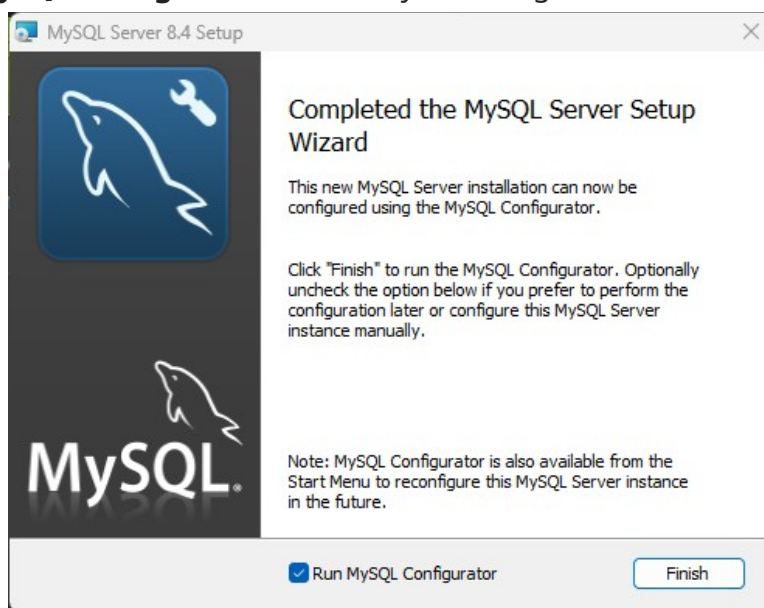

Selecting the Typical setup type

5. Click **Install**. You may have to give it user access rights in Windows.

Ready to install

6. Check **"Run MySQL Configurator."** You may have to give it user access rights in Windows.

Launching the MySQL Configurator

2. Configure MySQL

Walk through the configurator. I used the defaults.

Port: The standard, well-known port for MySQL is 3306, but you can use a different port.

When setting up the accounts:

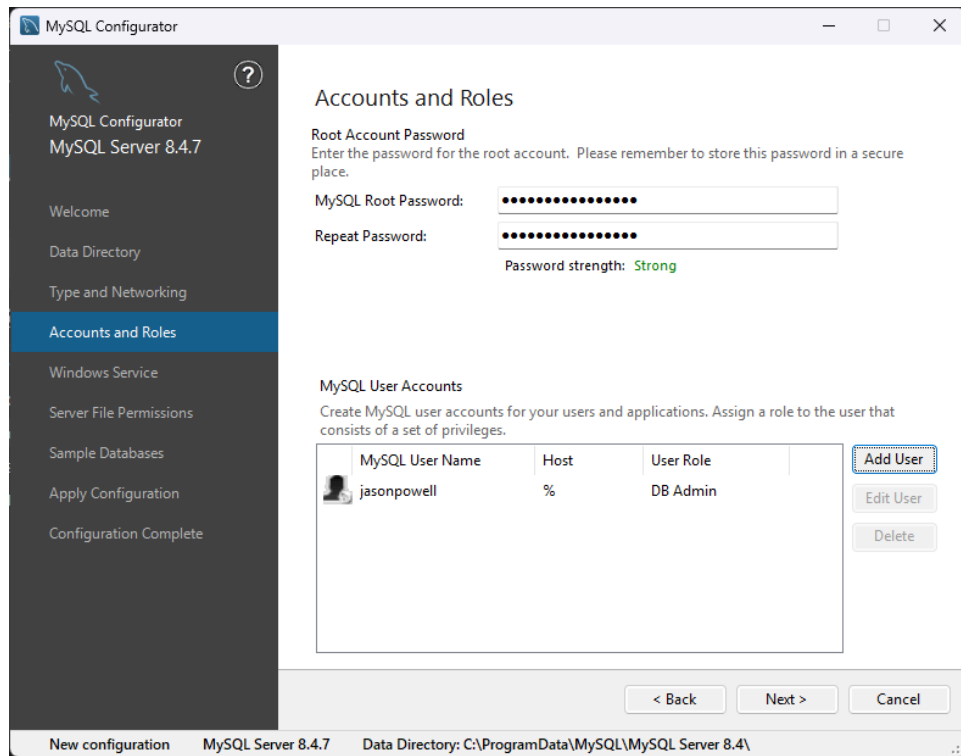

- Set the root password to something secure and memorable.
- I recommend adding a DB Admin user so you do not have to use the root account.
- I typically add additional accounts for various development purposes, but you can add more later.

If you are on Windows, set it up as a Windows Service. I typically uncheck the system startup

option, but you must remember to start the service up before connecting to it. I use the Standard System Account.

I selected the option to create the Sakila and World databases for experimenting.

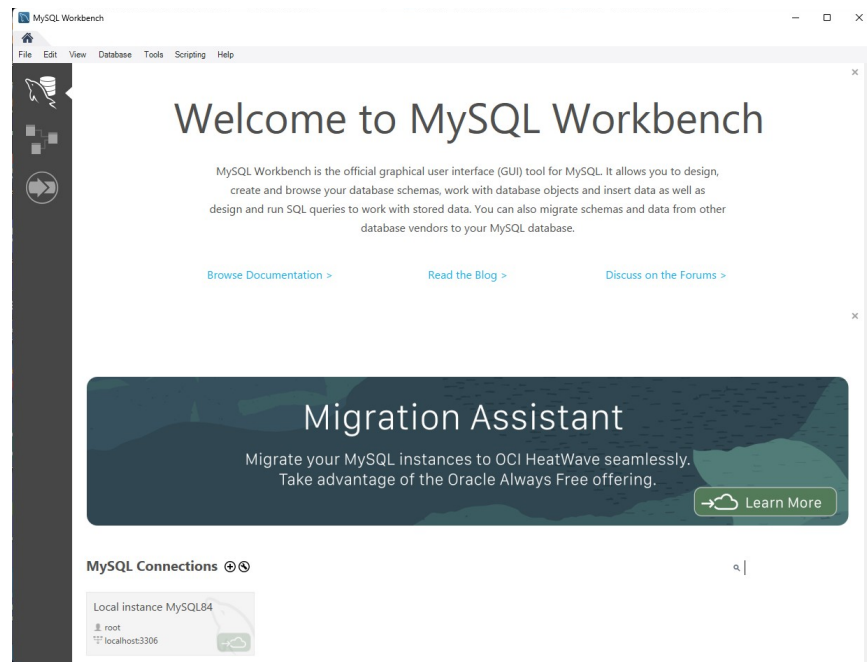

When done, it should start up the service, but you may have to reboot.

Reviewing the configuration before applying it

3. Install and Connect MySQL Workbench

1. Install MySQL Workbench. I used all the default options.
2. Run Workbench. It should recognize your root account.

Workbench recognizing the root account

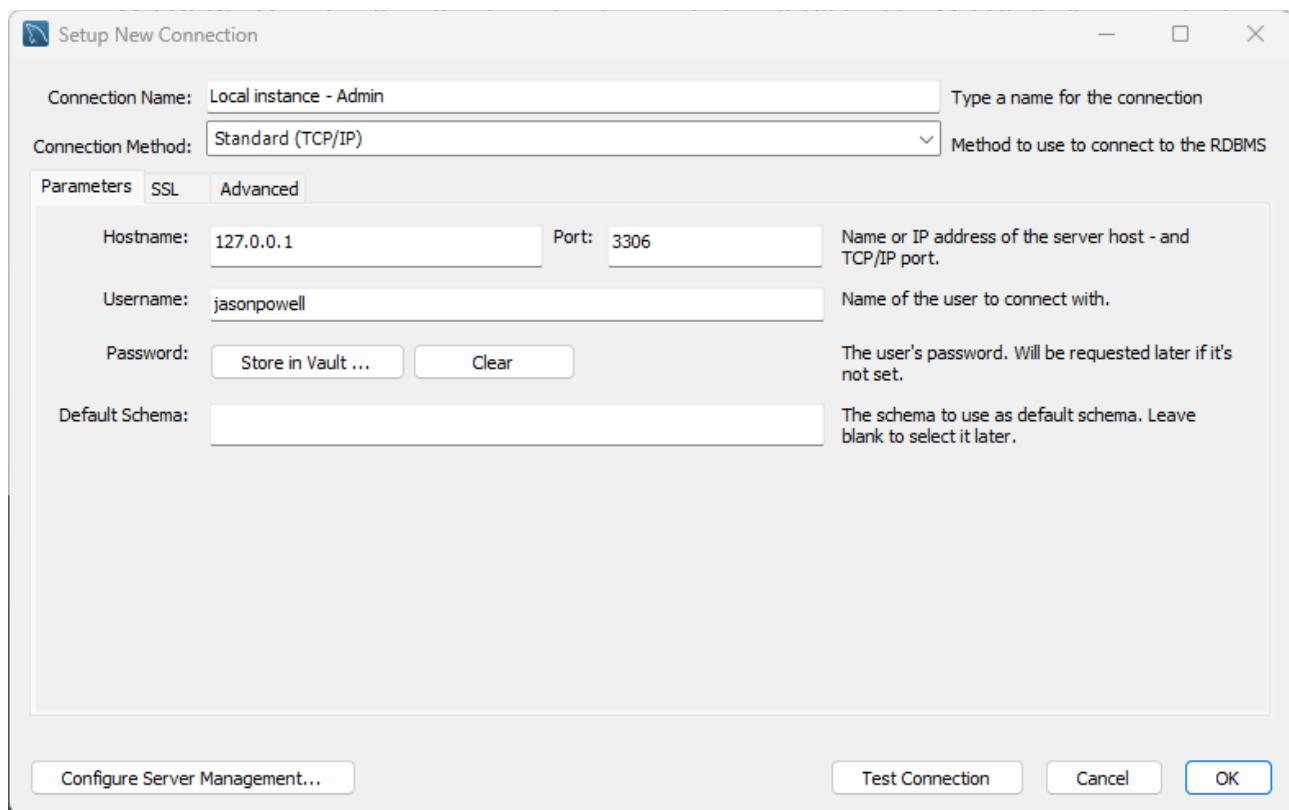

I recommend adding your DB Admin account:

1. Click **MySQL Connections** above **Local Instance MySQL84**.
2. Give the connection a name.
3. Set the name to your DB Admin account name.
4. You can add the password to the vault if you want.
5. Click **Test Connection** to see if it works.

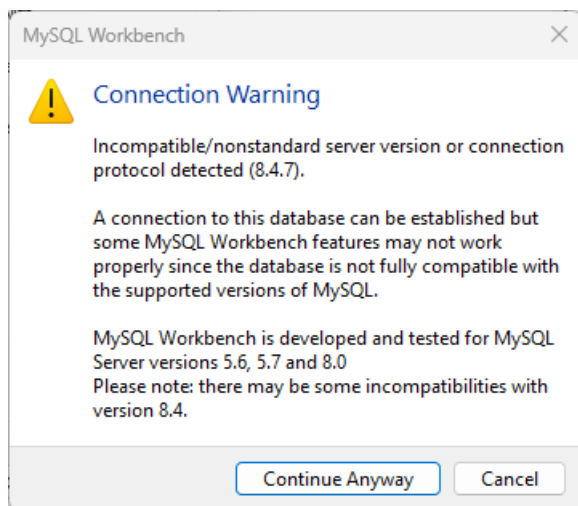

Note: You may get an incompatibility issues warning. I am unsure whether it will affect anything we do, but if it does, we will adapt.

After setting up the connection, try it. You may get the compatibility warning each time unless you check the "Don't Show Message" option.

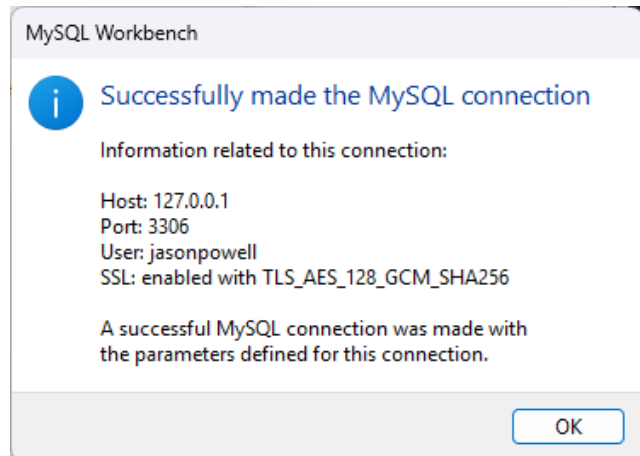

Please spend a few minutes navigating the menu and exploring its options.
