

①

```

Split(A[], first, last)
if (first == last)
    return
else
    mid = (first + last) / 2
    split(A[], first, mid)
    split(A[], mid+1, last)
    
```

②

③

Find the max value

if (Subarray has 1 element)
Return that value

else
return max of the left subarray or right subarray

```

Max(A[], first, last)
if (first == last)
    return A[first]
else
    mid = (first + last) / 2
    left = Max(A[], first, mid)
    right = Max(A[], mid+1, last)
    if (left > right)
        return left
    else
        return right
    
```

Fascinating...
Spock challenges you to code it.
